Studying Spin Glasses via Combinatorial Optimization

Frauke Liers

Emmy Noether Junior Research Group, Department of Computer Science, University of Cologne

Dec 11 th, 2007

 develop, improve and implement algorithms for optimization problems occuring in physics: ground states of

- Ising spin glasses in different dimensions
- Potts glasses
- Potts glasses for $q \to \infty$
- etc.
- study their physics together with physics colleagues

We always compute exact ground states! methods we use:

- polynomial algorithms (matching, maximum flow algorithms, etc.)
- branch-and-bound or branch-and-cut algorithms with exponential worst-case running time

- develop, improve and implement algorithms for optimization problems occuring in physics: ground states of
 - Ising spin glasses in different dimensions
 - Potts glasses
 - Potts glasses for $q
 ightarrow \infty$
 - etc.
- study their physics together with physics colleagues

We always compute exact ground states! methods we use:

- branch-and-bound or branch-and-cut algorithms with exponential worst-case running time

Spin Glasses

e.g. $Rb_2Cu_{1-x}Co_xF_4$ experiments (Cannella & Mydosh 1972) reveal: at low temperatures: \rightarrow phase transition spin glass state Edwards Anderson Model (1975)

- short-range model
- interactions randomly chosen
 - $J_{ij} \in \{+1, -1\}$ or
 - Gaussian distributed
- $H(S) = -\sum_{\langle i,j \rangle} J_{ij}S_iS_j$, with spin variables S_i

ground state: $\min\{H(\underline{S}) \mid \underline{S} \text{ is spin configuration}\}$

• $B^*L^{1.28}$ as fct. of 1/L works well with

• O(1/L) finite size effects. $B^*(L) = uL^{-y_B}(1 + v/L) \Rightarrow 1.28 \le y_B \le 1.30$

We validated the predictions of the droplet/scaling picture:

- we find $1.28 \leq \delta \leq 1.32$ by more careful analysis
- earlier discrepances to $\delta = 1.282$ because analytic contributions to magnetization curve were not treated
- direct measurement of the magnetic length yields 1.28 ≤ y_B ≤ 1.30
- relevant spin clusters are compact, random magnetization

- 1 Hard Ising Spin Glass Instances
- 2 2d Ising Spin Glasses in a Field
- **3** Potts Glasses
- 4 Potts Glasses with $q \to \infty$

with Bissan Ghaddar, Miguel Anjos (U. Waterloo, Canada)

B. Ghaddar, M. Anjos, FL (submitted)

A spin can be in k different states q₁,... q_k
 Hamiltonian:

$$H = -\sum_{\langle i,j\rangle} J_{ij}\delta_{q_iq_j}$$

- we solve the problem also via branch-and-cut
- however: the bounds through linear optimization are very weak in practice and
- can be considerably improved by positive semidefinite optimization
- still: gs determination for Potts glasses is considerably more difficult in practice than for Ising spin glasses

with Bissan Ghaddar, Miguel Anjos (U. Waterloo, Canada)

semidefinite programming (SDP) problem: minimize a linear function of a symmetric matrix X subject to linear constraints on X, with X being positive semidefinite.

at each node of the branch-and-cut tree:

- **1** use pos. semidef. optimization to obtain a LB
- 2 add valid inequalities to get a tighter LB
- 6 find a feasible solution to get an UB
- choose an edge (ij) to branch on if optimality cannot yet be proven

at each node of the branch-and-cut tree:

Hard Ising Spin Glass Instances
 2d Ising Spin Glasses in a Field
 Potts Glasses
 Potts Glasses with q → ∞

Potts Glasses with $q ightarrow \infty$

with Diana Fanghänel (Cologne)

D. Fanghänel, FL (in preparation)

Juhasz, Rieger, Iglòi (2001) have shown: for many states the dominant contribution to the partition function is

$$\max_{A\in E(G)}q^{f(A)},$$

f(A) = number of connected components in $A(G) + \sum_{i,j \in A(G)} J_{ij}$

Potts Glasses with $q ightarrow \infty$

Juhasz, Rieger, Iglòi (2001) have shown: for many states the dominant contribution to the partition function is

$$\max_{A\in E(G)}q^{f(A)},$$

f(A) = number of connected components in $A(G) + \sum_{i,j \in A(G)} J_{ij}$

ass.
$$J_{ij} = 0.1 : f(A) = 4 + 17 * 0.1$$

Solution Approaches

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- Angláis d'Auriac et al. presented an exact algorithm
- it uses many maximum-flow calculations (polynomial, but takes long)
- our work: reduce the number of maximum-flow calculations by graph-theoretic considerations
